Semester Project 2

Aud Kristin Samuelsen

Design

What went well on the project

The design is based on work done in previous assignments, both in terms of color choices, layout and functions.

I am satisfied with the totality of the design and UI, with good usability and color composition.

The design works well both on desktop and in mobile.

As always, the design is done according to the mobile-first strategy.

What was difficult/didn't go well on the project

Due to technical issues I had to make some design changes.

Among other things, the use of Modal to edit / add products I was not happy with and therefore chose to remove this. This led to me having to make major changes both on design and not least on the technical relatively late in the project.

What would you do differently next time

Next time I will look at the experience I have gained in this and previous projects so that I can more quickly make design choices that are not limited by my technical skills. I also want to spend more time getting others to test the design and features so that practical and logical challenges can be identified more quickly

Technical

What went well on the project

Most of the coding worked well and I could use a lot of what I have worked with earlier in the study. A lot of coding I could get from previous tasks I have done, also adapt the code to this task and in addition add what was missing.

I use bootstrap and use sass to modify bootstrap according to my own needs. The use of Bootstrap made me save too much when it comes to design elements.

I'm glad I got to shop the cart symbol that shows the number of items in the cart. And I'm glad I got to onsubmit handling also with file validation.

What was difficult/didn't go well on the project

At the beginning of the project, I made some technical choices that in the long run created some problems for me, and I had to make several changes to my scripts in particular to make the solution work satisfactorily.

I had originally chosen to use modal for editing a product and for adding a new product. The complexity of this became so great that I chose to change the approach to the traditional solution with my own page to add / edit products.

I struggled a lot to get validation by submit, but I finally managed to find solutions that work. It may not be the best way to do it but it worked in the end.

What would you do differently next time

Next time I will build the code less complex. I want to use several independent files, especially when it comes to script, and I want to make sure that I finish the coding in such a good time that I have time to clean and organize the code in a good way.
